1. Graphical user interface, a visual way to interact with code.
2. The user clicks buttons or types which is an action.
3. No, you need to add a Jpanel first.
4. No. labels simply just display text or images.
5. I think because a GUI is a graphical USER interface so the user inputs clicks or types which causes the events to happen.
6. A label simply displays text or images while a button can display text as well but buttons can be assigned to events.
8. You can choose different layouts such as absolutelayout, gridlayout, or flowlayout
13. Use (double) or (int)
14. 8
15. A combo box would be better because combo boxes are good to display a couple of answers.
